WEEK 07 · GROUP PROJECT

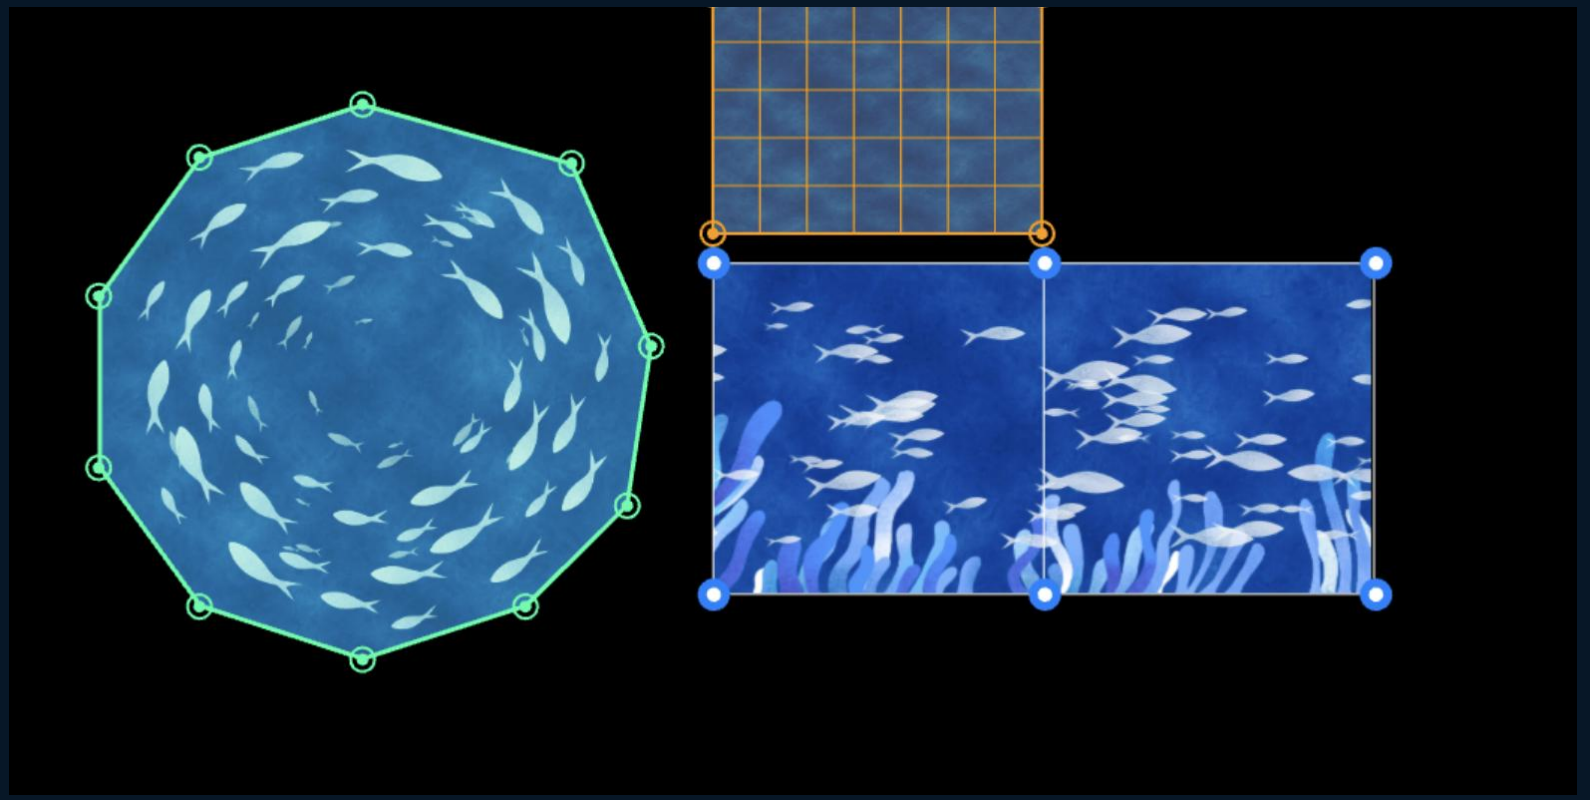

Ocean

Watercolor illustration × animation × projection mapping

Hanni

Underwater World

My project explores the impact of ocean pollution on marine life through projection mapping. I created an underwater environment with swimming fish, swaying coral, and floating plastic waste. Through this contrast between beautiful marine life and plastic pollution, I hope to raise awareness of the threats facing our oceans.

From still images to layered animation

Watercolor textures and pale silhouettes establish a consistent visual language.

01 Watercolor base

02 Coral silhouettes

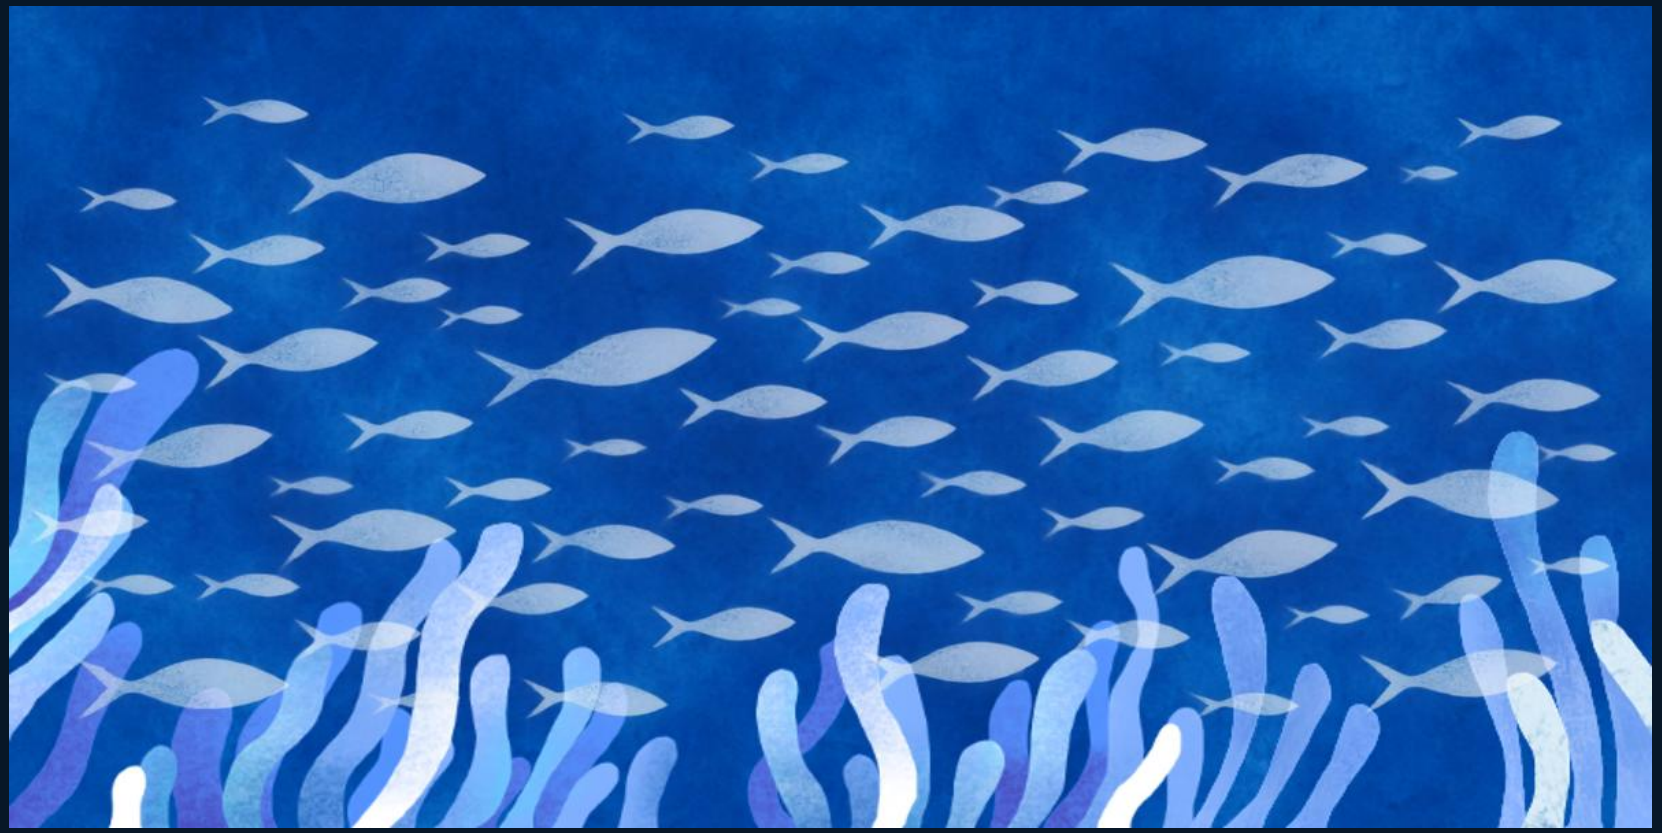

03 Fish + circular flow

I designed these elements as separate visual layers so I could control their movement independently.

Three coral layers, one flowing ocean

The three coral layers sway at different speeds and rhythms.

BACKGROUND

CORAL 1 / 2 / 3

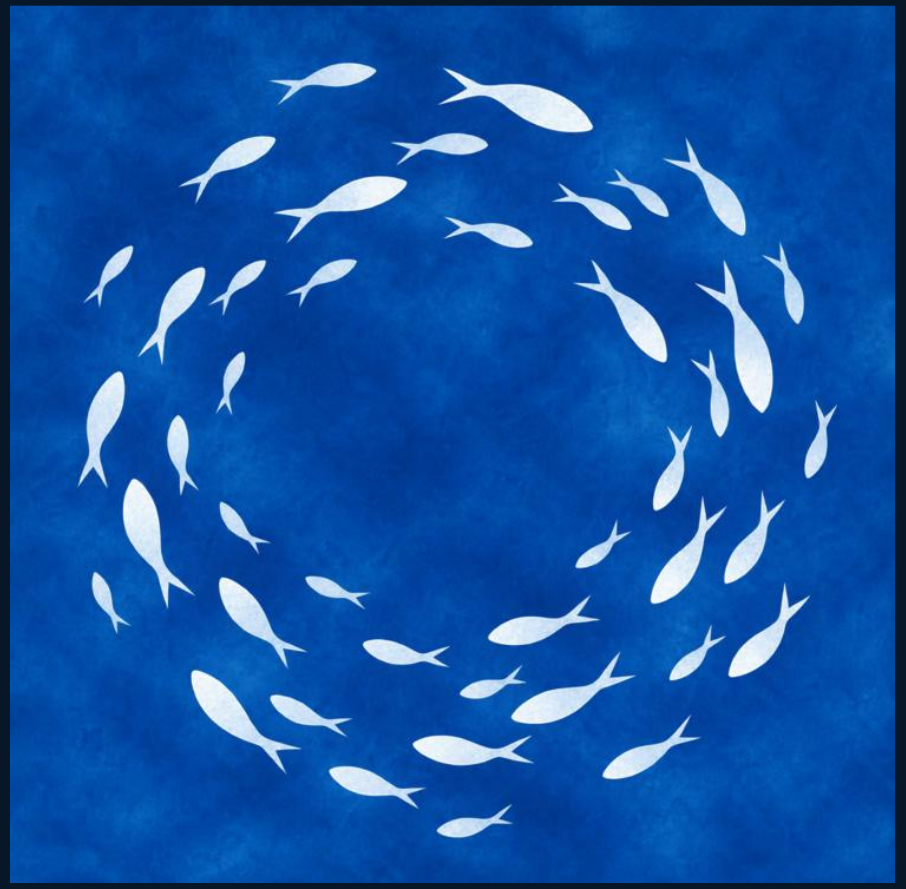

FISH

I used sine waves and a connected mesh to make the coral bend naturally.

The fish were later separated into individual sprites for more natural movement.

Circular ocean currents

I drew the fish in Procreate and separated the visual elements into layers.

PLASTIC

What I learned

Projection mapping changed how I think about animation and physical materials.

I had to consider the physical edges, the connection between surfaces, and how motion should respond to form.
